

AI does not design. It does the other 80%

Using AI across my daily workflow for faster execution, better decisions, rapid prototyping, and shipping real-world products.

- The workflow ↗
- What it built ↗

THE LOOP

AI as part of my everyday workflow.

I use AI throughout the product design process to move faster, think deeper, and deliver better products, without replacing design thinking or human judgment.

01	AUTOMATION	Task Automation	Component generation, documentation, release notes, design tokens. The repetitive half of the job, off my plate.
02	RESEARCH	Research	Competitor analysis, interview synthesis, UX patterns — the groundwork, in a fraction of the usual time.
03	ANALYSIS	Analysis & Decision Making	Breaking down requirements, mapping flows, finding edge cases and challenging assumptions before design starts.
04	DEVELOPMENT	Code & Development	React, Tailwind, production-ready components. Shortens the gap between design and implementation.
05	PROTOTYPING	Fast Prototyping	Interactive prototypes and lightweight MVPs instead of static mockups — validated before engineering time is spent.
06	TESTING	Testing & Validation	Accessibility reviews, UX audits, visual consistency and design QA, before issues reach users.
07	AGENTS	MCPs & AI Agents	Figma, Claude, Cursor, GitHub and custom MCP servers in one loop, sharing context instead of working in isolation.

AI WORK

Built this way, and running.

Not experiments. Each of these is in production, in a store, or in somebody else's package.json.

PURPOSE

A design system that an agent can build against — so a component request becomes a component, not a ticket.

HELP

1 / 3 OPENED

THREE BUILDS, AND THE RUN EACH ONE PERFORMS.

PICK A BUILD ON THE LEFT — THE CANVAS DRAWS ITS SHAPE, THE LOG PRINTS ITS RUN.

AI TOOLS

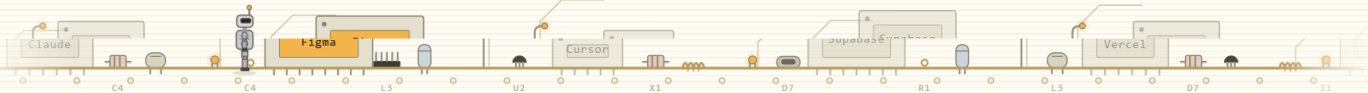

The stack, and what each is for.

Reached for daily. Short on purpose — a tool used once a quarter is a tool you are bad at.
